

#### Overview

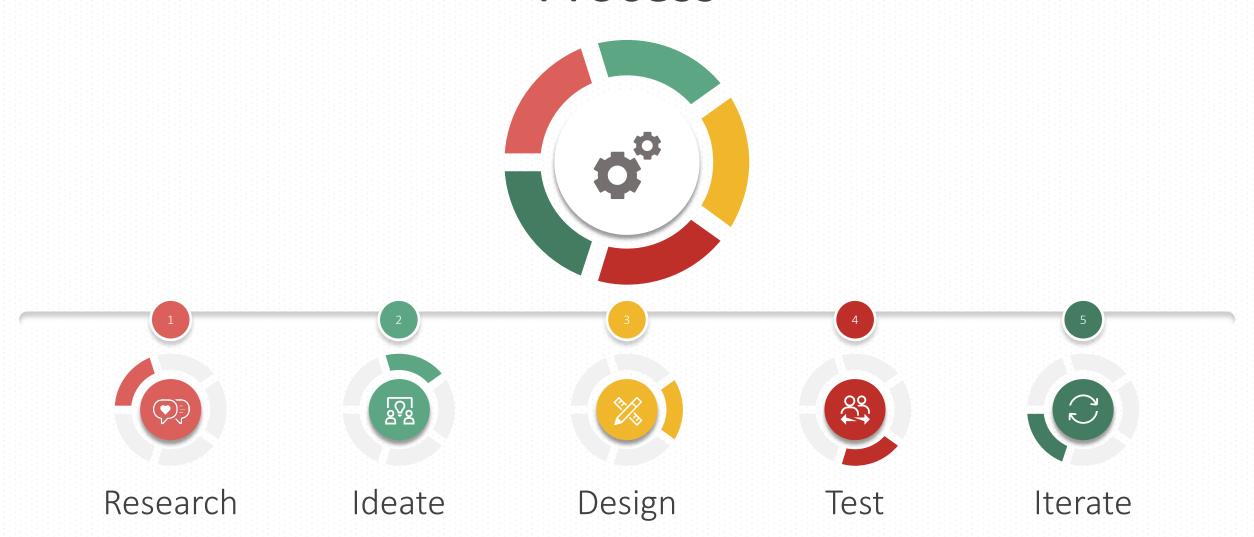

The SAP has an existing Cloud Platform for it's CRM solution. The product has always faced criticism for its user experience issues and lack of Omnichannel capabilities which is crucial for call centers.

I was assigned to work on a new concept and got support to conduct some research and get some insights from the Product Managers and our Innovation Partners. One year has been passed and my rest of the team joined to realize this product called as Customer Experience Management.

This document focuses on the process of realizing this concept design to an actual product for SAP Service Cloud.

**Device at work**: Desktop computer, 32" monitor

Product usage frequency: 100 % of a 8hr working day

Social Media

Chat

**Email** 

Accuracy Speed

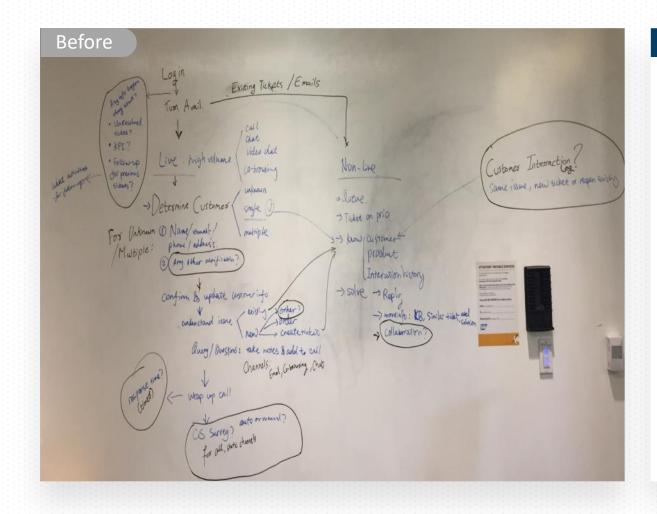

Collaboration

Customer Satisfaction

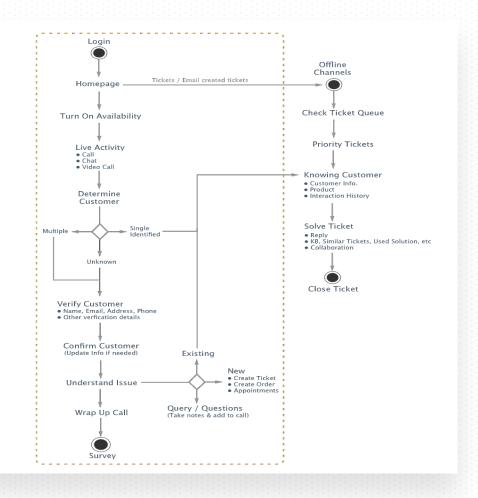

Tech Savvy **Ambition** Data Driven Visually Driven

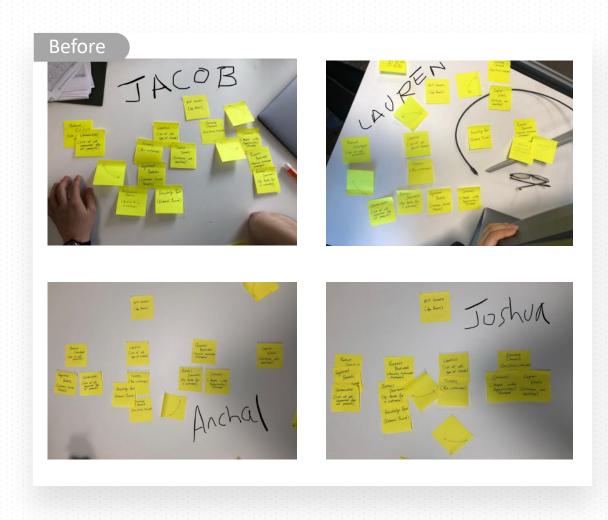

### **User Flows**

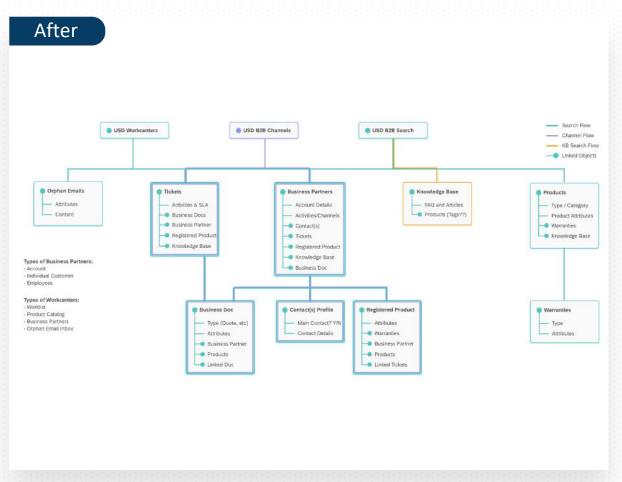

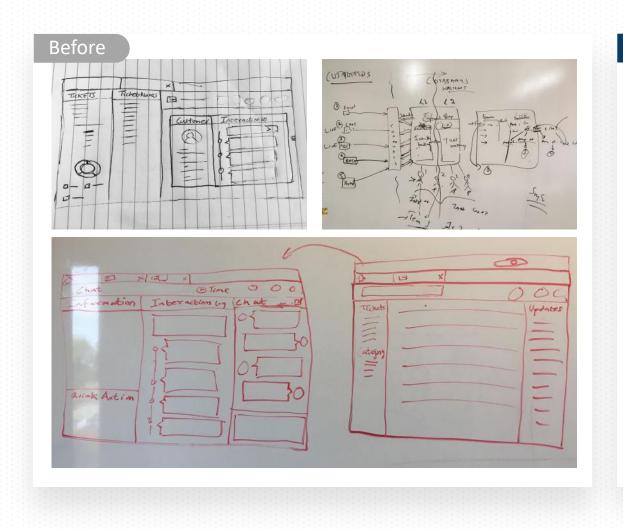

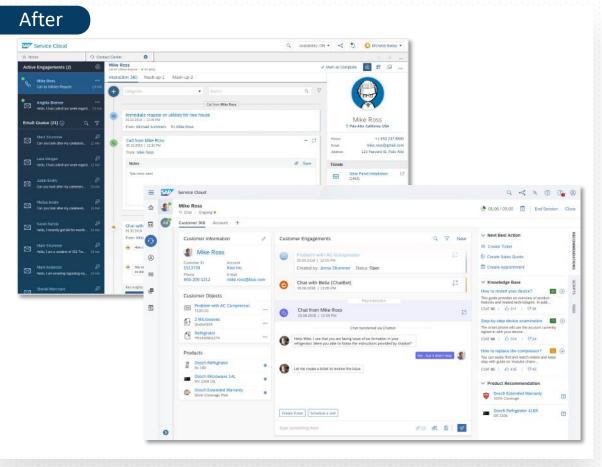

#### Information Architecture

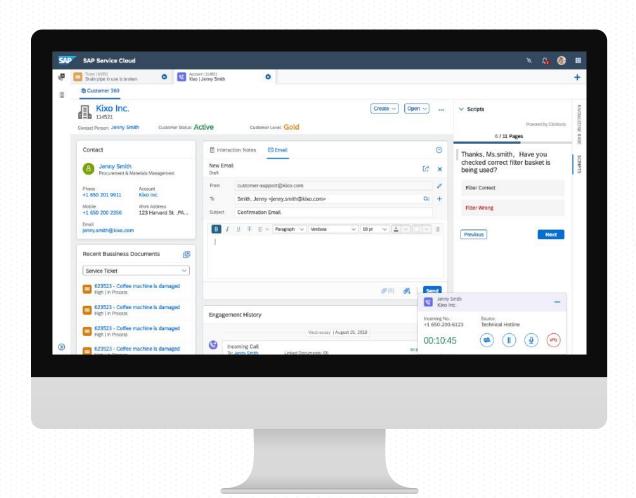

# Wireframes and Initial Concept

#### Screen: Customer Overview

Service Agent Michelle's most common frustration from existing product was to find right information about customer at right time.

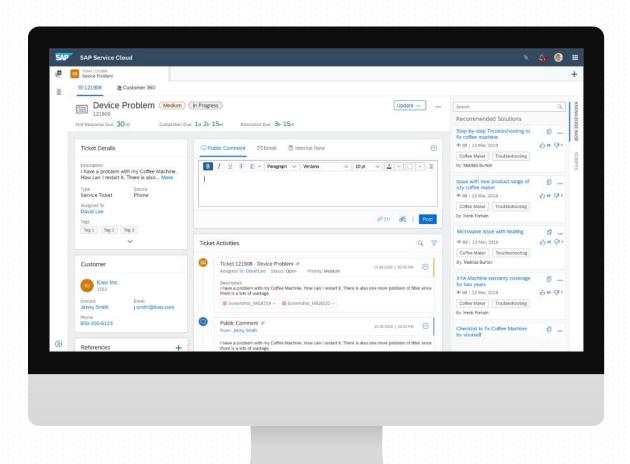

This screen provides the 360° view of a customer to Michelle. She can now get customer details, their history, documents, and knowledge articles.

In a solution like this which should be able to cater different business process. An administrator should always be able to configure UI as per their need.

#### Screen: Business Documents

Michelle always had a problem to track the activities and information about any business documents like tickets, sales quotes, and sales order.

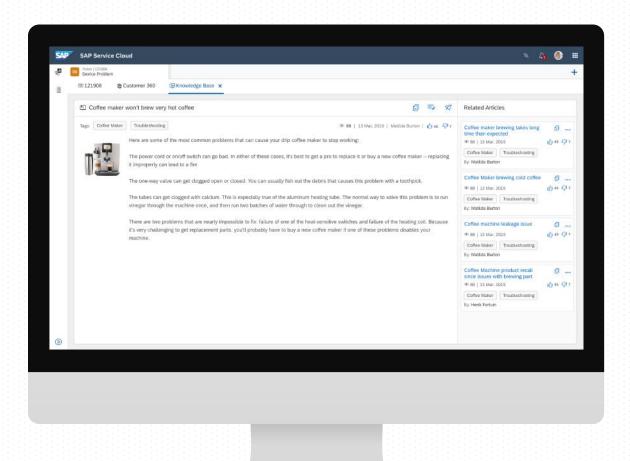

The new business document experience provides all the information including the progress and all the activities in a chronological order.

Each document has different piece of information to deal with i.e. a service ticket can't be used for returns. Therefore UI should be configurable for all use cases.

# Screen: Knowledge Base

Michelle always struggled to find correct solution during her engagement with end consumers. Looking for different source of information is always tedious.

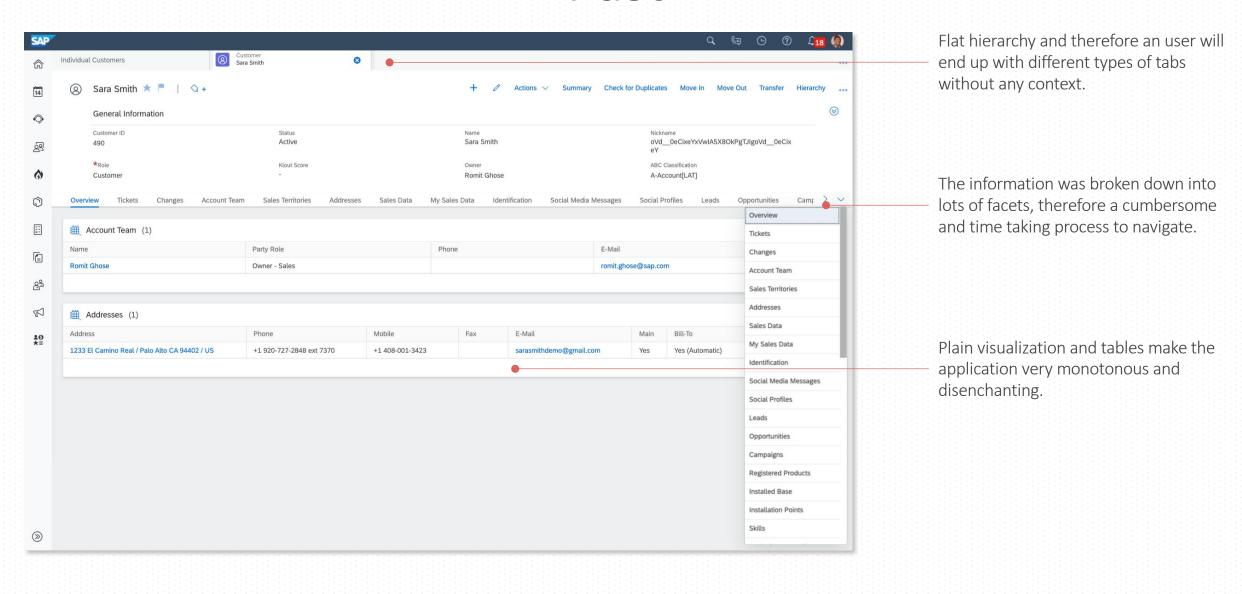

The new solution makes sure that Michelle gets all the information she needs regardless of which page she is looking at.

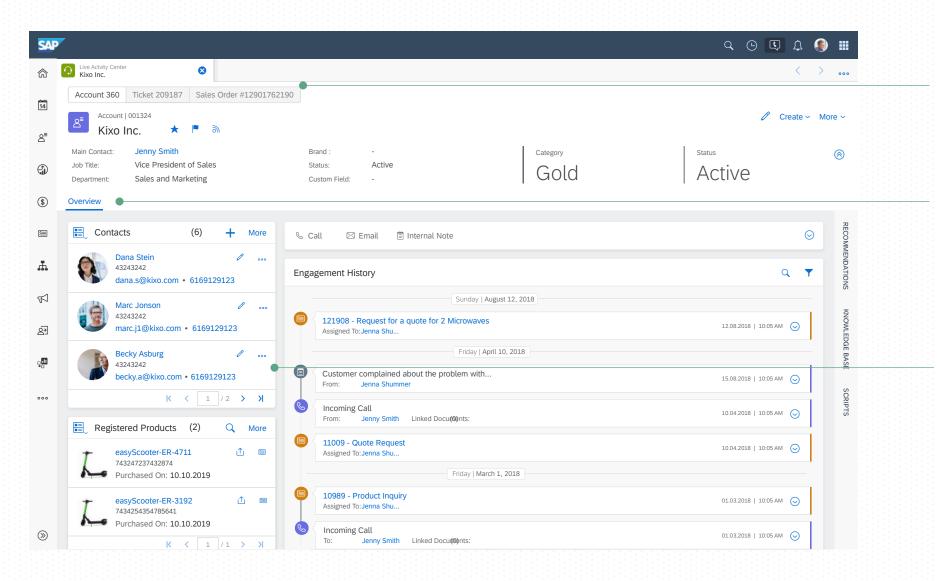

The future scope for this is to provide well integration in work process i.e. Machine learning should suggest the contextual information as per Michelle's needs.

#### **Past**

Revisiting Information Architecture made the session handling possible which let users open information in context.

No more need of facets to browse the useful information. The customers can use this level for their customization.

Better visualization of information makes the information less wordy and interesting.
